ABOUT

Hello, I'm Amina Ennaji, a Business Intelligence
Developer with five years of experience across diverse
industries, including retail, energy, and banking.
My expertise spans a wide range of technologies, such
as Power BI, Azure Synapse, Snowflake, SQL, PL/SQL,
Scrum, and Azure DevOps. Over the years, I've honed not
only my technical skills but also my soft skills, enhancing
my ability to manage daily tasks, build strong
relationships with colleagues and clients, and foster
trust.

This blend of technical and interpersonal skills has enabled me to excel as a consultant and deliver impactful solutions.

INFO AND NOTES

In this portfolio, you'll find a variety of dashboards I've developed, each showcasing different styles, data sources, and tailored for various clients, all utilizing Power BI. All reports are published on Power BI Services.

Please note that the reports are presented in French, as I was working in France during their creation, which is why the language reflects that context.

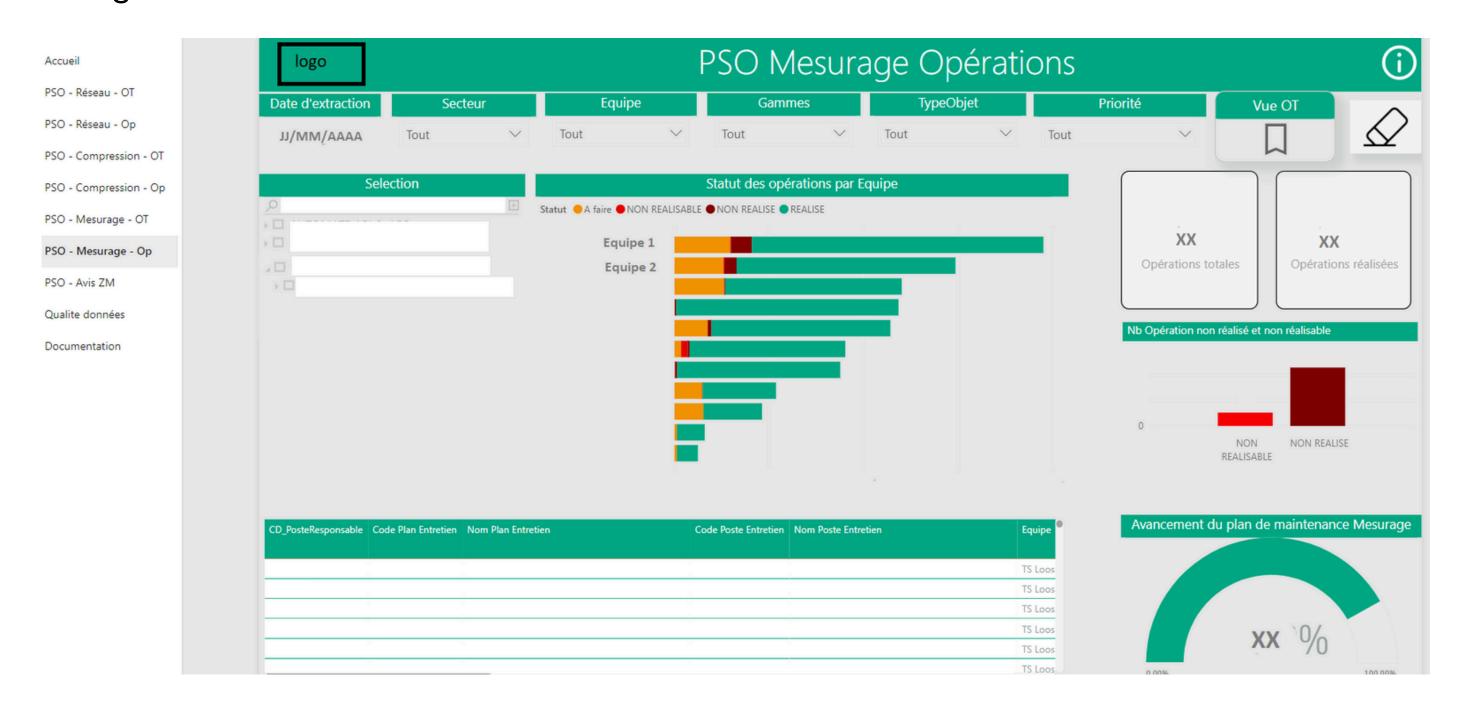

PORTFOLIO

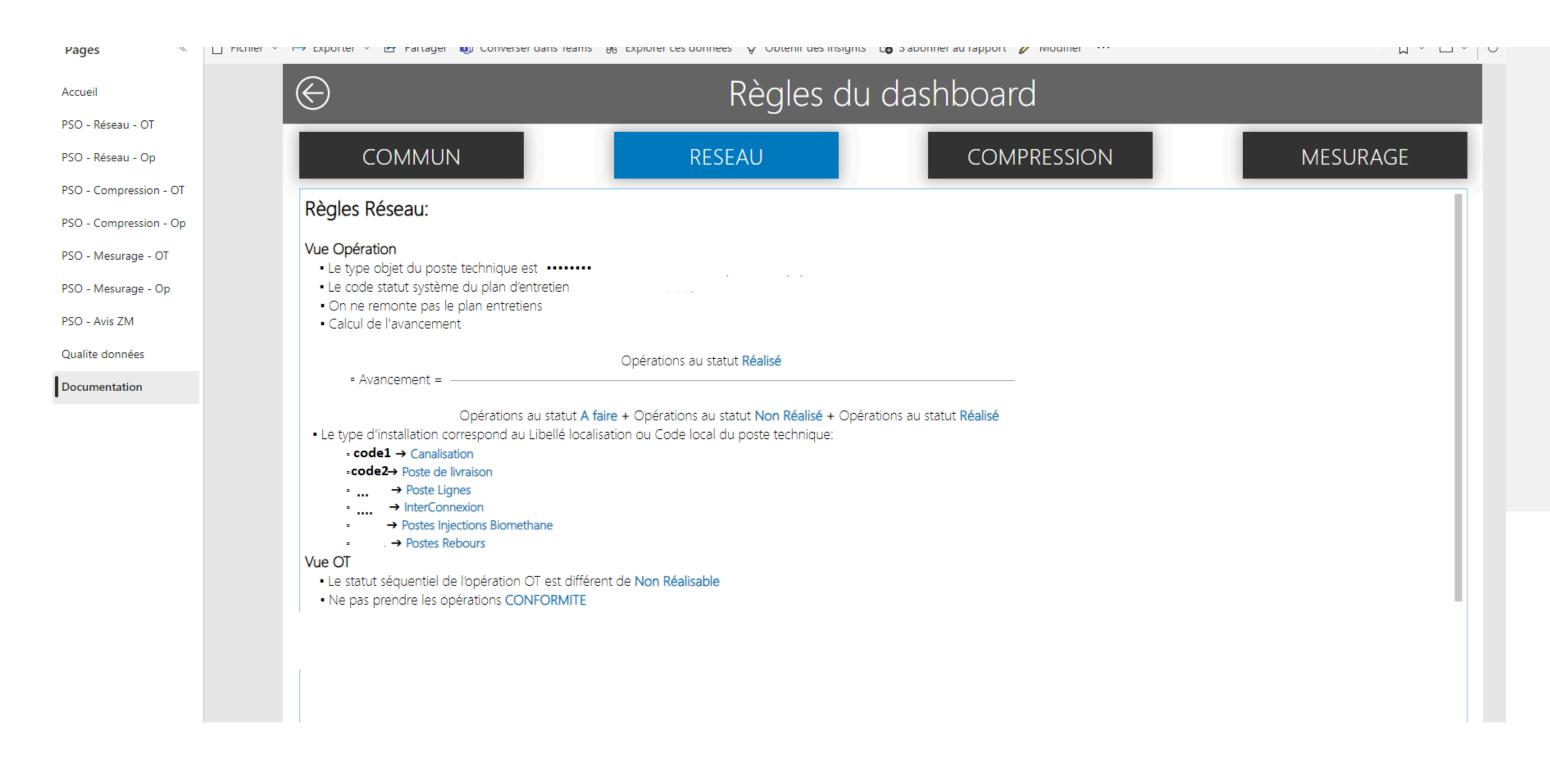

The dashboard featured here, titled "**Performance and Work Security**," was created using Power BI and sourced from a Snowflake database. The data originates from SAP and covers all maintenance and work activities performed over the years across various gas transportation stations. This dashboard provides valuable insights into annual operations, highlighting completed tasks, outstanding items, and potential delays. It also helps in developing strategies for improved performance and results.

figure 1: The home page

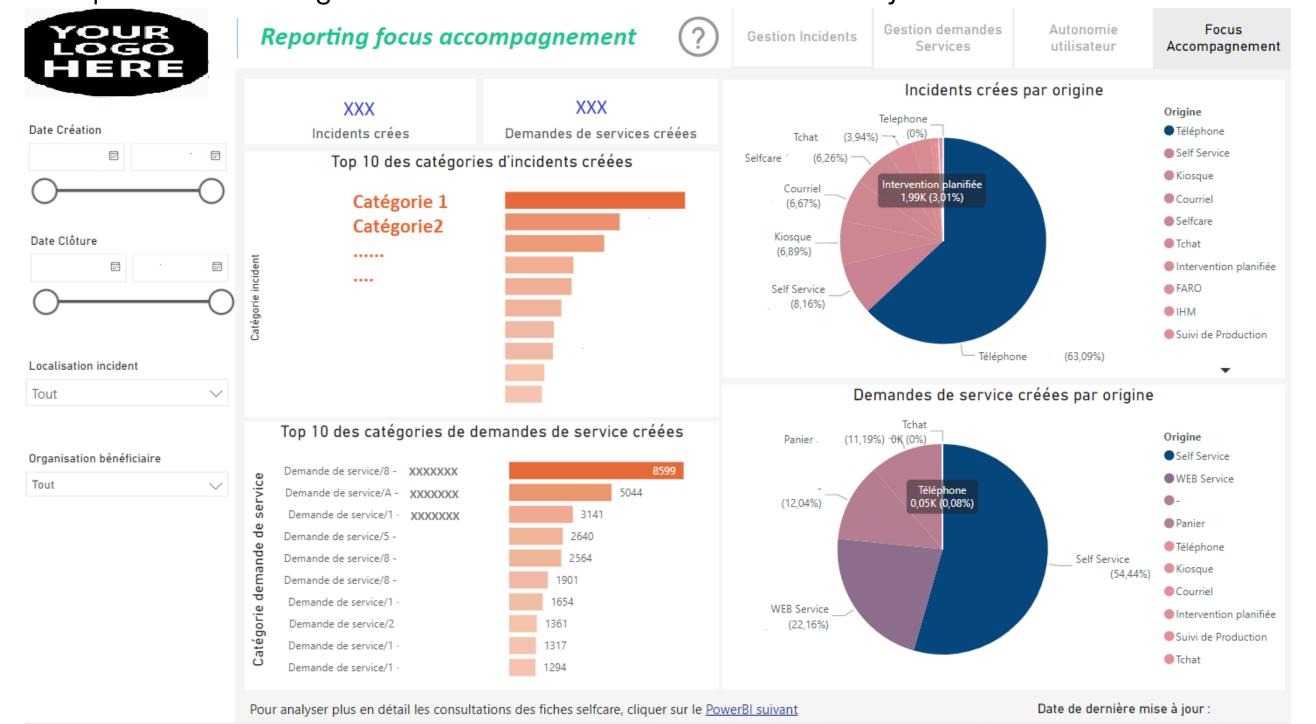

This page is designed specifically for users who specialize in measurement. It includes filters for data extraction date, team, department, and other relevant information to help users quickly find the data they need. The page features a histogram displaying operations by team—categorized as completed, pending, or in progress. Below the histogram, a detailed table interacts with all the filters, providing further insights.

Every Dashboard i created comes with a documentation which will help the users remember the key rules and how we calculate certain values and for the new employees to take hand on the dashboard and be able to use it easily

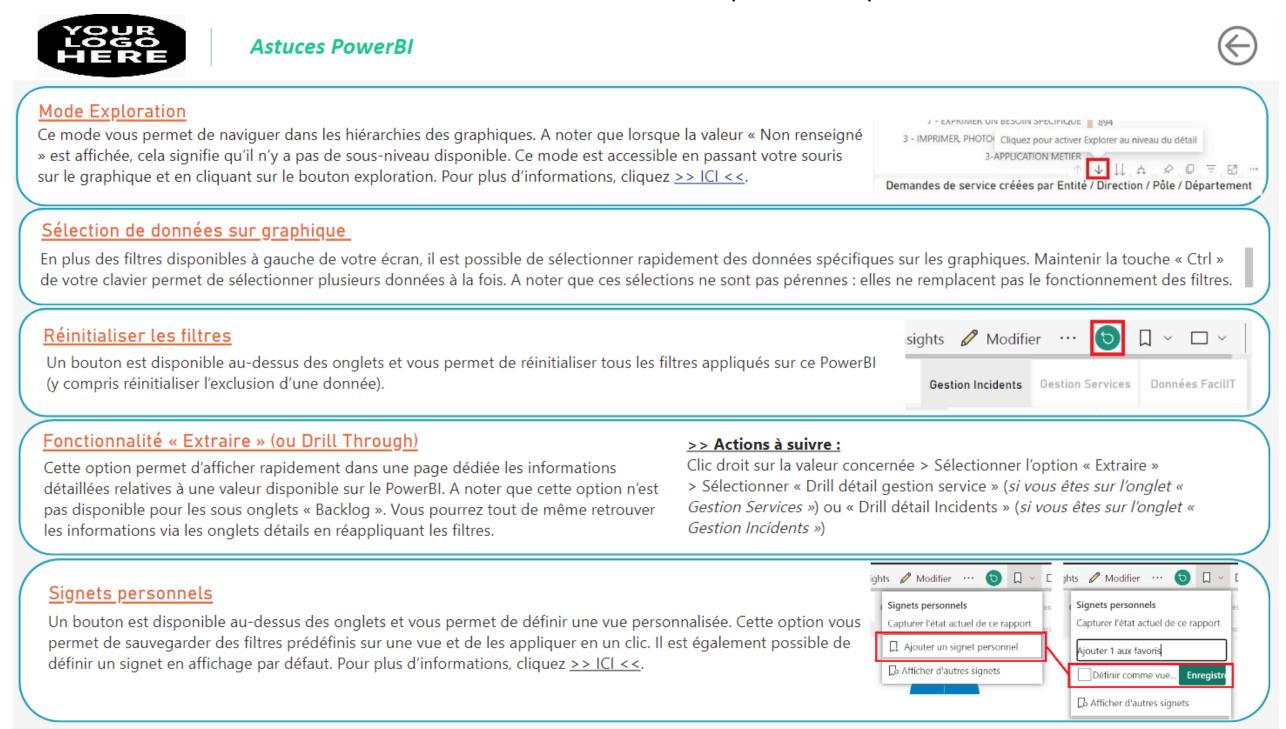

This dashboard is sourced from a ticketing tool called Facil'It, where employees can submit tickets for incidents, problems, changes, or service requests. The app allows us to track the workflow from the creation of each ticket through to its resolution. This dashboard helps us track incidents by detailing who created them, who was affected, how much time was spent on each, and any comments made. It provides a comprehensive view of all relevant details, enabling us to identify recurring problems each year and develop effective strategies to resolve or avoid them more efficiently.

Each page has a link to other pages in this case each page is dedicated for a type of tickets (Incident, Service, and each page had other buttons that will redirect to pages wether to have a global view or detailed or a backlog

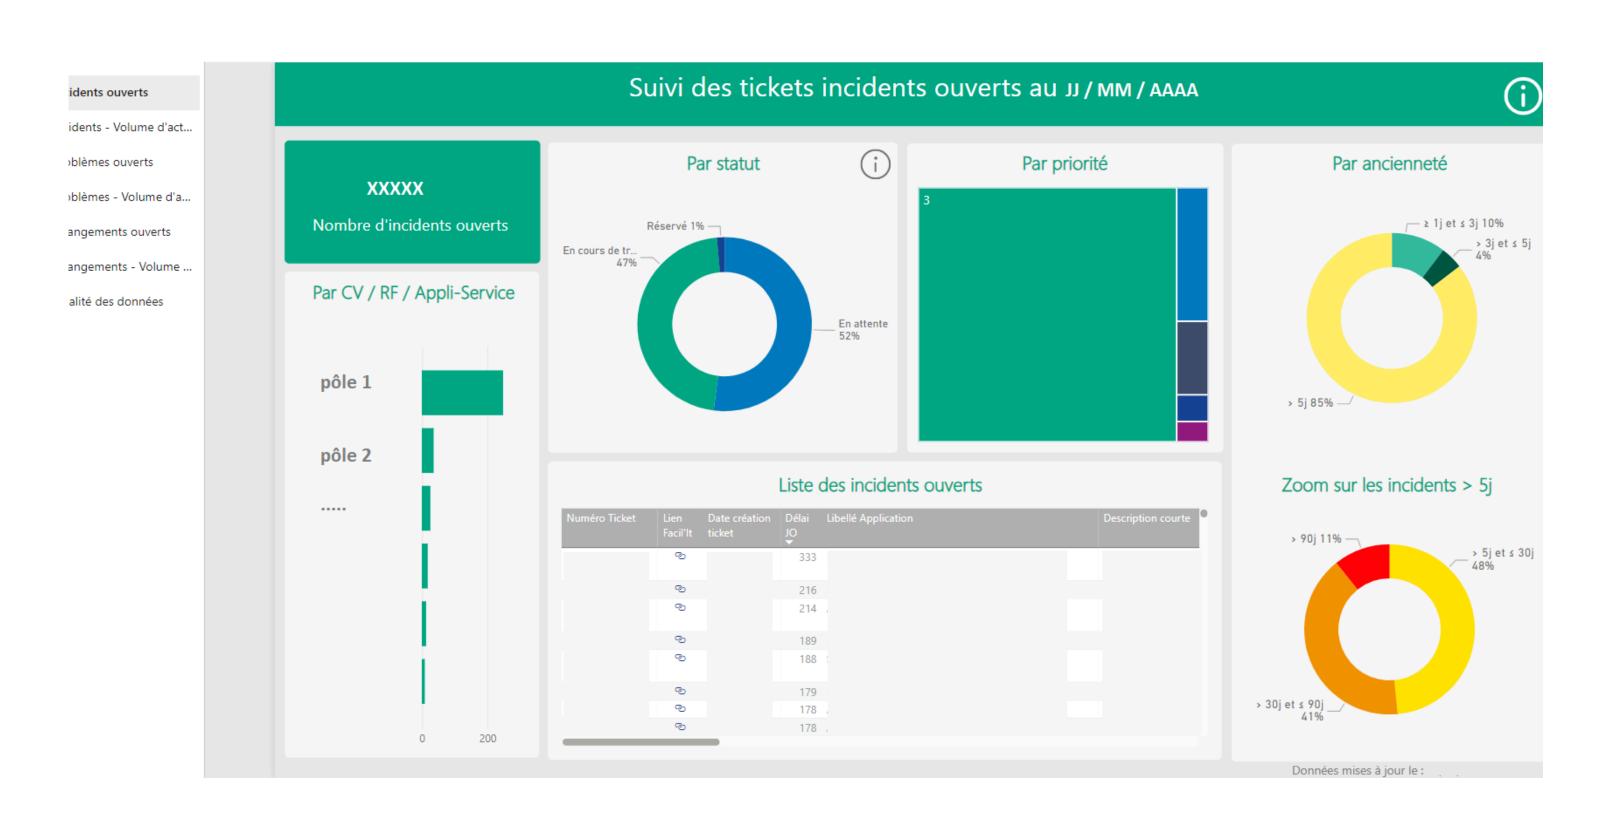

After few workshops with the product owner we always think of the best way to make the report easy to use and that the users know all the tips so the experience can be better, like in this example where we tried to explain how to read and use the dashboard as well as few power bi tips

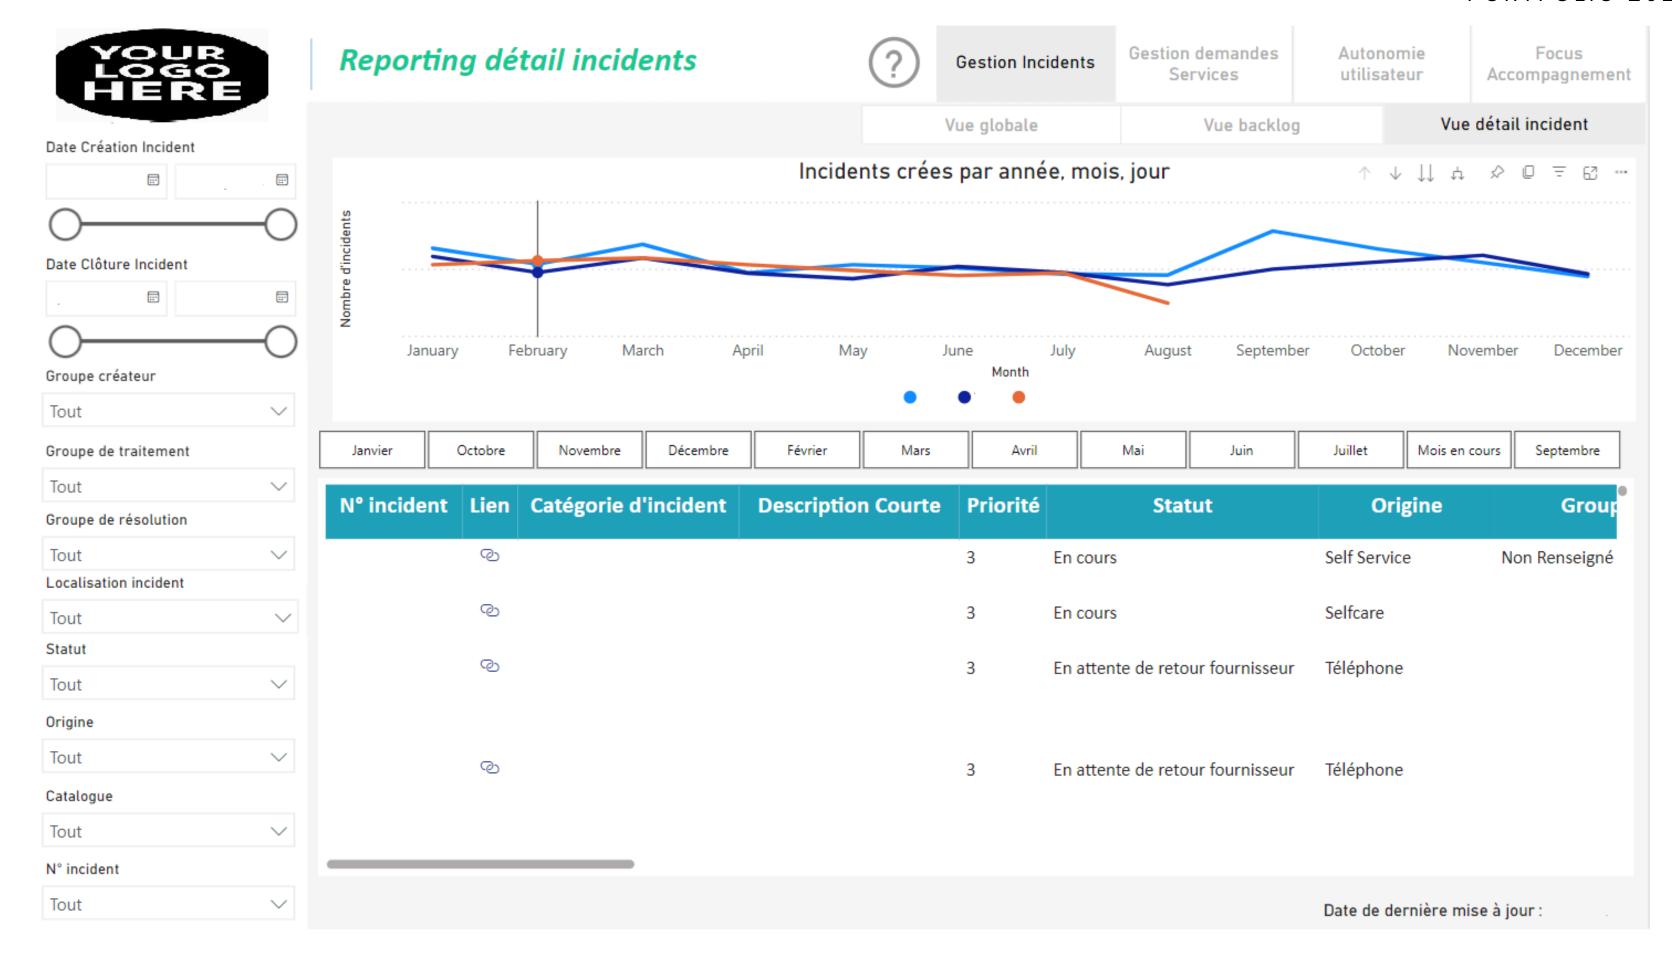

In other dashboards along with the client we decided to add a page called data quality to highlight the anormal data in order for the client to correct those information in the source as it can be just writing problem or just someone forgot to fill the right information

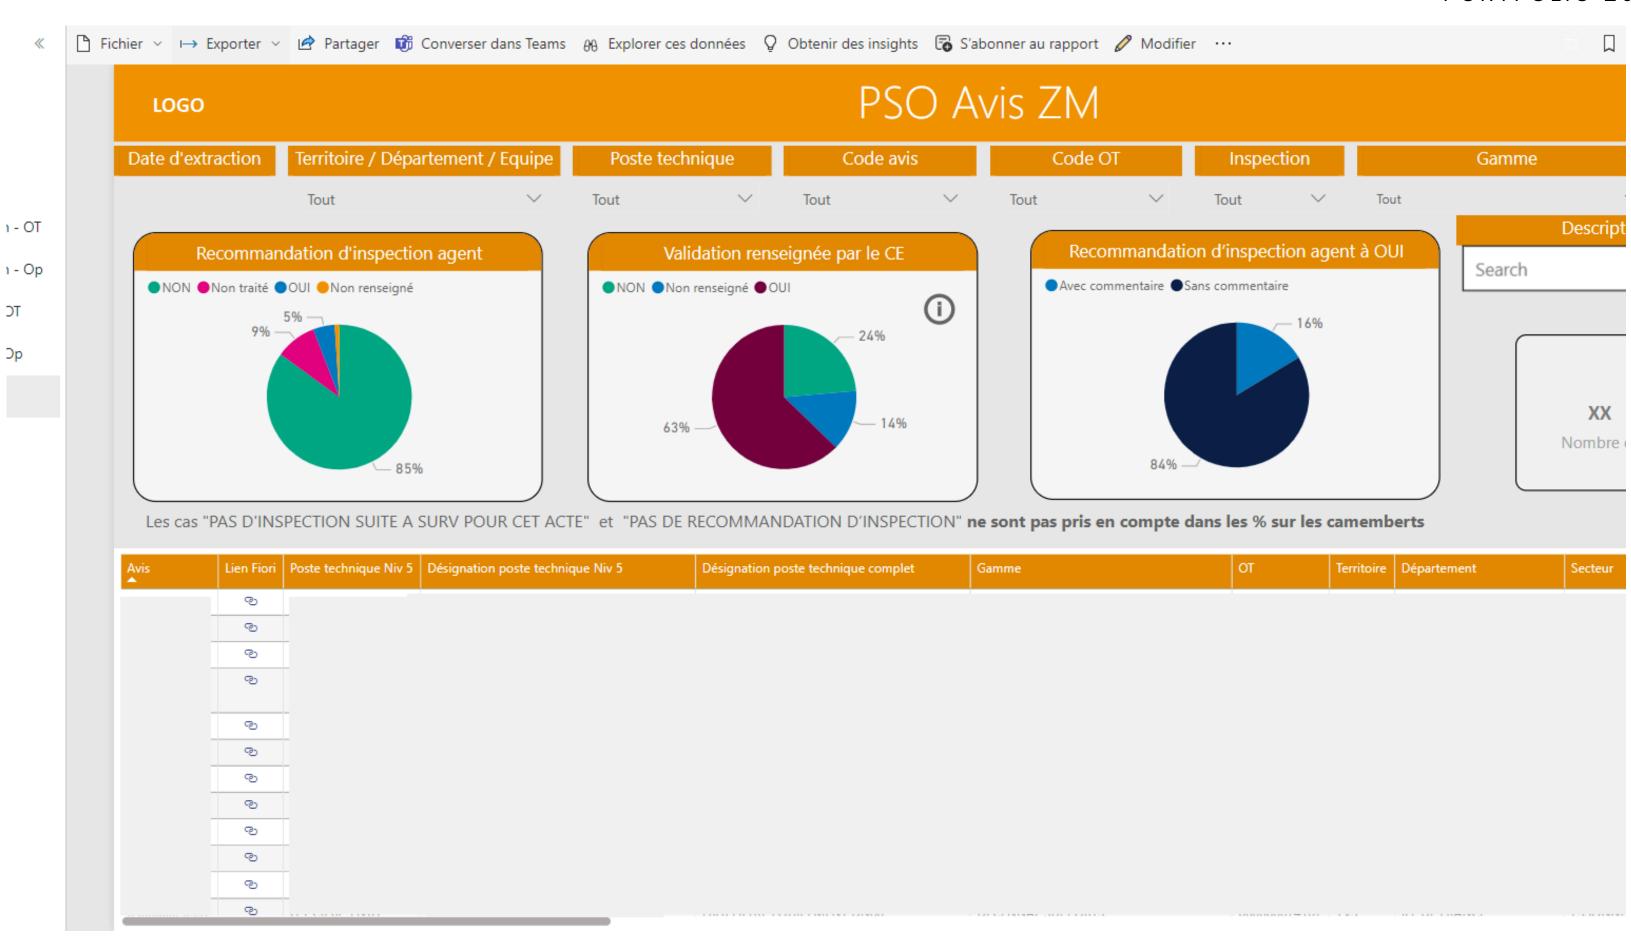

In the following pages you will find other examples of reports i worked on
